

Hello everyone. Our project is Latex calculator plugin that can be used in Wox, a quick launcher app in Windows OS. This plugin can help you solve many mathematical problems quickly, which can be seen on the right side. Alright. Let's do a quick demo

I am going to press alt and space to activate Wox and input the brick keyword to activate the calculator. After that, you can choose the type of problem you need as the option and then input your latex formula. Like this, the script will calculate your question and output the result as the Latex syntax as well.
